SCRIPT AND FACT CHECK

From Farmland to Token

How a regulated real-world asset becomes a compliant token on Redbelly Network, through Tokeniser

Asset	An Australian farmland fund. Registered fund (unit trust). Investors hold units in the fund.
Why this asset	Tokeniser is built for Australian funds and companies. A farmland fund is a real, regulated structure that anyone can picture: land you can see, owned through units that investors hold. It lets the video show the difference between the asset (the farmland, which does not change) and the record of who owns it (which becomes a token).
Runtime	86.7 seconds (1:26.7). 16:9, 1920 x 1080, 60 fps, subtitles burned in and supplied as SRT and WebVTT.
Audience	Someone with no crypto or finance background.
Voiceover	en_GB-alba-medium (Piper (piper-tts)). Alba speech corpus, University of Edinburgh DataShare, CC BY 4.0.
Claims	23 claims about Redbelly Network or Tokeniser, each matched to a verbatim quote from the supplied resources (section 2).
Note	Illustrative example. Not a real fund. No prices, returns or performance are shown or implied.

1. Script

Timecodes come from the rendered voiceover. The on-screen column lists every word drawn in the frame during that scene.

Time	Scene	Voiceover	On-screen text	Visual
0:00.0 0:06.8	**The question**	How does a real-world asset become a token? Let's follow one asset, step by step.	From real-world asset to compliant token Tokeniser on Redbelly Network Set up · Investors · Issue · Transfer	Dark slate opening. A token draws itself and fills with Tokeniser mint, the title appears, then a four stop journey rail (Set up, Investors, Issue, Transfer) draws in. The dark layer lifts away and the rail settles at the top right, where it tracks progress for the rest of the video.

Time	Scene	Voiceover	On-screen text	Visual
0:06.8 0:15.1	**The asset**	Meet an Australian farmland fund. Investors hold its units, and the register sits across separate systems, updated after the fact.	Illustrative example Australian farmland fund · Units Investors · Register today Spreadsheet · Email · Admin system Updated after the fact	Isometric farmland builds up parcel by parcel inside a dashed frame that marks the fund. A row of unit tiles appears below it, linked to three investors. On the right, the register today appears as three separate documents (spreadsheet, email, admin system) with broken links between them and a clock.
0:15.1 0:20.5	**What tokenisation means**	Tokenisation records that ownership as digital tokens, with the fund's rules programmed in.	The idea Ownership, recorded as digital tokens Rules, programmed in	The farmland stays where it is and the old register fades. The unit tiles lift and turn into tokens. A small rules badge settles onto each token.
0:20.5 0:28.7	**Two layers**	The manager uses Tokeniser, a familiar platform. Underneath runs Redbelly Network, Australia's public digital token infrastructure.	Platform and network · Tokeniser Familiar platform Australian farmland fund Units, as tokens · Redbelly Network Public digital token infrastructure	A Tokeniser platform window slides in and the tokens settle into it. Then the dark Redbelly Network layer rises in underneath the window, with the Redbelly logo and a chain of blocks. These two layers stay on screen as the stage for the four steps.
0:28.7 0:36.8	STEP 1 **Step 1. Set up**	Step one: set up. The fund is verified, and its rules, like wholesale investors only, are encoded into the token.	Step 1 · Set up · Fund setup Australian farmland fund · Pending Fund verified · Rules Wholesale investors only Transfer restrictions Rules encoded into the token	In the platform window, the fund setup card changes from Pending to Fund verified. Two rule chips, Wholesale investors only and Transfer restrictions, appear and fly to the token, which gains a rules badge and a lock.
0:36.8 0:44.1	STEP 2 **Step 2. Investors**	Step two: investors. Each is verified through Averer, then gets a wallet on Redbelly Network to hold tokens.	Step 2 · Investors · Averer Identity verified · Investor classified Not verified · No tokens Verified through Averer Wallet on Redbelly Network	A verification scan labelled Averer passes over three investor cards. Two investors are verified and their wallets drop onto the Redbelly Network layer. The third is not verified and gets no wallet and no tokens.

Time	Scene	Voiceover	On-screen text	Visual
0:44.1 0:51.0	STEP 3 **Step 3. Issue**	Step three: issue. Tokens are minted on Redbelly Network into verified wallets, and the register updates immediately.	Step 3 · Issue · Register · Live · Updated · Minted on Redbelly Network · Register updated	A block on the Redbelly Network layer lights up and tokens are minted from it into the two verified wallets. At the same moment the register in the platform window fills in and marks each row Updated.
0:51.0 0:59.3	STEP 4 **Step 4. Transfer**	Step four: transfer. Every transfer is checked against the rules first. A transfer to an ineligible investor is rejected.	Step 4 · Transfer · Rules check · Wholesale investors only · Transfer restrictions · Ineligible investor · Rejected · Checked against the rules · Ineligible investor: rejected	A token leaves the first wallet for the rules check in the platform window, addressed to an ineligible investor. The Wholesale investors only rule fails, the transfer is stamped Rejected and the token returns to its wallet. Nothing reaches the network.
0:59.3 1:09.7	STEP 4 **Settlement**	A compliant one settles on Redbelly in seconds. When investors hold their own wallets, transfer and payment complete together. Once confirmed, it is final.	Eligible investor · Checks passed · Settles in seconds · Transfer and payment, together · Final · Final once confirmed	The same token is sent to an eligible investor. Both rules pass. On the Redbelly Network layer the token and the payment cross between the two wallets at the same block, which then locks and is marked Final.
1:09.7 1:15.3	**The record**	Every check, transfer and rejection is recorded, ready for auditors and regulators.	Audit trail · Recorded · Audit log · Check · Transfer · Rejection · 10:41:52 · 10:42:05 · 10:42:06 · Auditors · Regulators · Ready for auditors and regulators	The platform window shows an audit log: a check, a transfer and a rejection, each marked Recorded, while matching blocks lock on the network layer. Two readers, Auditors and Regulators, connect to the log.
1:15.3 1:22.5	**Same asset, new record**	Same farmland, same fund. Its units are now compliant tokens on Redbelly Network, issued through Tokeniser.	The result · Same farmland, same fund. · Now compliant tokens on Redbelly Network · Issued through Tokeniser	The farmland returns at the top, unchanged, linked by dashed lines to the tokens held in the wallets on the Redbelly Network layer. All four steps on the rail are complete.

Time	Scene	Voiceover	On-screen text	Visual
1:22.5 1:26.7	**Close**	*No voiceover. End card holds.*	Built on Redbelly Network tokeniser.com Illustrative example. General information only, not financial advice.	Calm slate end card: the Tokeniser logo, Built on Redbelly Network with the Redbelly Network logo, tokeniser.com and the illustrative example note.

2. Fact check

Every claim about Redbelly Network or Tokeniser, with the exact words of the supplied resource it comes from. Quotes are verbatim and are checked automatically against dated snapshots of each page.

S09	Compliant transfers settle on Redbelly Network in seconds.	“Compliant transfers settle atomically on Redbelly Network in seconds.”	https://tokeniser.com/resources/knowledge-hub/platform/how-does-tokeniser-work Snapshot 2026-10-25
S09	With wallets the investors hold themselves (non-custodial), transfer and payment complete together.	“For non-custodial wallets, atomic settlements, transfer and payment complete simultaneously in seconds.”	https://tokeniser.com/resources/knowledge-hub/platform/how-does-tokeniser-work Snapshot 2026-10-25
S09	Once confirmed, a transaction on Redbelly is final and cannot be reversed.	“Deterministic finality ensures transactions are confirmed once and cannot be reversed, providing certainty for financial markets”	https://redbelly.network/asset-tokenisation Snapshot 2026-10-25
S10	Every check, transfer and rejection is recorded and available to administrators, auditors and regulators.	“Every compliance check, every transfer, and every rejection is recorded on-chain and in the platform's compliance log. This creates an immutable audit trail that is available to fund administrators, auditors, and regulators at any time.”	https://tokeniser.com/resources/knowledge-hub/australia/how-tokeniser-handles-investor-compliance Snapshot 2026-10-25
S11	Tokeniser issues compliant tokens representing ownership interests on Redbelly Network.	“Tokeniser issues digital tokens representing ownership interests on Redbelly Network blockchain.”	https://tokeniser.com/resources/knowledge-hub/platform/how-does-tokeniser-work Snapshot 2026-10-25
S11	Tokeniser provides compliant asset tokenisation.	“Tokeniser Pty. Ltd. is an Australian company providing compliant asset tokenisation and management solutions.”	https://tokeniser.com/ Snapshot 2026-10-25
S12	Tokeniser is built on Redbelly Network.	“Built on Redbelly, Australia's public digital token infrastructure and the network chosen by Australia's central bank for its digital currency project.”	https://tokeniser.com/product/getting-started Snapshot 2026-10-25

3. What the video does not say

- No prices, returns, yields, performance or investment advice. The fund is an illustrative example and no amounts are shown.
- No promise of liquidity. Tokeniser's own FAQ states that tokenisation does not guarantee liquidity, so the video does not mention liquidity at all.
- Atomic settlement is described only for investors who hold their own (non-custodial) wallets, as the Tokeniser knowledge hub specifies.
- No performance figures for Redbelly Network (throughput, uptime, validators) are used, so nothing in the video can age out of date.

4. Sources

Text snapshots of every page are kept in the project files (evidence/) with their capture time and SHA-256 hash.
